Is this a "Fast & Focused" Search Request? (Circle One) ☒ YES ☐ NO

A "Fast & Focused" Search is completed in 2-3 hours (maximum). The search must be on a very specific topic and meet certain criteria. The criteria are posted in EIC2100 and on the EIC2100 NPL Web Page at <http://ptoweb/patents/stic/stic-tc2100.htm>.

What is the topic, novelty, motivation, utility, or other specific details defining the desired focus of this search? Please include the concepts, synonyms, keywords, acronyms, definitions, strategies, and anything else that helps to describe the topic. Please attach a copy of the abstract, background, brief summary, pertinent claims and any citations of relevant art you have found.

system, Method and Apparatus providing lateral information for
Video/Audio Stream

- Please see Abstract, background and Summary.
- Please Concentrate on independent claims 1, 12, 19, 23 & 33 of the attached claims.

ABSTRACT

PROBLEM TO BE SOLVED: To minimize degradation of picture quality due to an error by completing decoding without **detecting** the error of encoding data by means of a decoding means and setting the head position of encoding data following next encoding data to a re-synchronous point when an investigation means **detects** the **occurrence** of discontinuity.
SOLUTION: A start code **detection** part 2 **detects** the start point of the high- **order** layer of **video data** and **sends** a bit stream to a syntax analysis part 3 with a layer indication signal. The syntax analysis part 3 analyzes layer data indicated by the layer indication signal and **extracts** encoding **data** . If a video packet header cannot normally be **detected** when a system reaches the terminal of a present video packet, for example, a re-synchronous point decision part 4 decides the video packet header appearing next to be a re- synchronous point and informs the start code **detection** part 2 of it with a re-synchronous point indication signal. Then, the system returns to normal decoding from the video packet header which is **detected** at the earliest time.

ABSTRACT

PROBLEM TO BE SOLVED: To ensure the **transmission** of **information** , secure reliability, availability, and maintainability by a single loop, and lower the cost by disconnecting a local terminal from a network and bypassing it

when the terminal device gets out of **order** .

SOLUTION: A terminal device 20 in a digital transmission network inserts and **extracts** a **video** signal and an audio signal into and from a reference signal inputted from an optical cable 421 through specific processes and sends the reference signal out to a next terminal device. At this time, if a frame synchronizing signal can not be received, a line control circuit 215 **detects** whether or not there is light input, judges that its device is faulty when the input is normal, and sends a fault signal out for a certain period and then passes **transmit data** through a bypass circuit 212. Consequently, when the network is constituted with a single loop, the network is maintained in the case of fault **occurrence** and a center device can specify a faulty terminal. Therefore, the constitution is simplified by adopting the single loop to constitute the network at low cost.

ABSTRACT

PROBLEM TO BE SOLVED: To reduce the circuit scale by providing an SOH, POS addition means, an H4 counter, and a VC assembly means to the circuit and relaying data received from a satellite channel to a ground channel network as SDH **transmission data** .

SOLUTION: A receiver side demodulates **transmission data** received from a satellite channel, a **data extract** section 11 **detects** a prescribed bit of a unique word in **transmission data** and an error correction code or the like and **extracts** succeeding **reception data** to the **bit** from a head because the data are burst data. On the other hand, an H4 counter 14 generates H4 bytes synchronously with the burst data and gives the data to a VC assembly section 5. The assembly section 5 inserts the H4 bytes to **data extracted** by the **data extract** section 11 in the **order** of multi-frames to assemble a virtual container of a VC-3. A POH is added to a container containing the data, and an SOH is added by an SOH addition section 7, and the result is relayed to a ground network as an STM-1 signal. The data are sent as burst data in the satellite channel.

ABSTRACT

PURPOSE: To reduce cost by processing data with a composite function at high speed and minimizing the capacity of memory for image data.
CONSTITUTION: Print data from a host device is first received by a print data receiving part 20 and then is divided into band lists by a division means 21. A scheduling means 22 **determines a development order** by which the divided print data is developed into **bit map data** and a **development** area into page memory. Next, a means for developing **data** by **segment** unit develops the divided print **data** into **bit map data** based on schedule information or allocation information, and stores the developed **bit map data** in page memory. In addition, an image transfer means 24 transfers the **bit map data** stored in page memory sequentially to a printing mechanism part 25 by segment unit. The printing mechanism part 25 actually prints the **bit map data**.

Abstract: High frequency (HF) radio is used for long haul or extended range communications in many situations. Under stressed HF channel conditions, the **supportable data** rate falls below that required by existing low bit rate speech coding algorithms. This paper presents research undertaken at DERA Malvern on the development of a real-time speech coding system which utilises **automatic speech recognition** (ASR) and synthesis technologies to achieve speech coding at **data** rates below 300 bps. A continuous speech **recogniser** is used to transcribe incoming speech as a sequence of sub-word units, termed acoustic **segments**. Prosodic **information** (pitch and duration) is combined with **segment** identity to form a serial **data stream** suitable for transmission. A parallel formant speech synthesiser is used to synthesise the speech at the receiver, using models trained to a particular talker's **voice** to establish talker characteristics. (9 Refs)

OPTIMAL SCHEDULING OF CDMA SYSTEMS (CELLULAR PHONES, WIRELESS TRANSMISSION, QUALITY OF SERVICE)

Author: RAMAKRISHNA, SUDHIR

Present cellular systems have mainly been designed to allow mobile users to interface to fixed telephone networks, and hence, have primarily been optimized for **voice transmission**. Future wireless systems, however, will be required to **support data** (i.e., non-voice) sources with a variety of rates and quality-of-service requirements. In this thesis, we attempt to enhance the efficiency of conventional CDMA systems with respect to the throughputs provided, with an emphasis on data sources. The basic approach followed in **order** to do so is to exploit the property of delay tolerance that is a characteristic of many such sources. The simplest case, namely, the uplink of a CDMA system with two user classes is considered. One of the classes consists of delay intolerant users requiring support for a constant **information bit** rate. The other class consists of delay tolerant users needing support for an **information bit** rate larger than a specified value. Both classes have certain respective quality of service (QOS) specifications. Certain common synchronization requirements are imposed on all the users. The objective is to maximize the throughput of the delay tolerant users, while meeting the QOS requirements of all the users. Starting from the constraints defining a conventional CDMA system, we propose a modification wherein the transmissions of the delay tolerant users are scheduled, so that only a limited number of them are transmitting information at any given time instant. It is shown that the proposed transmission scheme, which tends, in a special case, towards hybrid CDMA/TDMA for the delay tolerant users, provides throughput gains as compared to conventional CDMA under many conditions. These conditions are **identified in terms** of the various system parameters. It is also shown that the proposed transmission scheme imposes the same or lesser average transmit power requirements, and in cases of practical interest, identical peak power requirements, as compared to conventional CDMA.

The basic scheme is extended to include constraints on the inter-cell interference. A general result that follows is that given a set of delay tolerant users with certain (average and peak) power constraints, and certain inter-cell interference constraints, the per-user throughput may be maximized by time-scheduling a certain subset of the users. The behavior of the scheme in the presence of system imperfections, such as imperfect power control, is also investigated. Implementation issues and strategies, given

knowledge of certain system parameters, are indicated.

... design, linguistics, computer science, and library science, each system with its own unique perspective on how to **organize**, find, and use information effectively.

The growth of corporate intranets adds to the demand. Companies are willing...

...Today's document retrieval systems lump all information needs into a single process. New information tools will **separate** these different needs into **categories** and provide specific tools for each kind of need.

Here are some of these search types:

* Broad...

...returned will at best intersect that need spottily. Today's information sys terms require the searcher to **extract** terms that have the best chance of representing the question, while at the same time, eliminating extraneous...are already in development. Answer machines will become the technical underpinnings of knowledge management systems, providing single, **organized**, easy access to all the information in an. **organization** including the following:

- * Internal documents and databases in a variety of formats
- * Committee reports
- * External sources
- * Directories of people and skills
- * Tools to manipulate information and **extract** new knowledge

The trick will be to select the appropriate tools and then to present them as...

...whole: a new model for a information system that brings together all of the resources of an **organization** in any format.

If you approach your information system as a whole, then you will implement each new technology as a brick within an entire edifice. You could implement each technology **separately**, but ultimately, integration, of these technologies will create a knowledge management system arid even a decision support...

...not appear very frequently in documents not "about" that subject. This is the rudimentary idea behind relevance **ranking** in retrieval, systems.

Clusters of certain terms are even better indicators, that a document is about a...

...the term is in the whole database -- how many times it appears in every document in the **collection**. Rare terms ...for that document. Then it compares all, the scores and presents the highest first. This is relevance

ranking in a nutshell.

Statistics and patterns enter into advanced retrieval systems in a number of other contexts. For instance, in **order** to determine whether a document matches a query, the system must calculate the similarity of the document...

...these angles to give us a degree of similarity. This "vector space model" can help calculate relevance **ranking**, but it can also determine clusters or clumps of similar documents. This is the basis for most of the star **maps** or imaginary. Landscape visualizations used to display the contents of a database, or a retrieved set of...

...a very minor concept expressed in a rare term, then the rare term may skew the relevance **ranking**, since it has a higher, weight than the common term.

Remember also that statistical systems do not...

...with other environmental terms, if a query is more than one word long, a statistical system would **rank** such a false drop low. Hence, search engines look very stupid by making errors that any human...

...the terms being retrieved is not part of the equation for statistical processing.

Natural-Language Processing

In **order** to build a state-of-the-art information system, one must **extract** as much meaning as possible from each document. A list of words, or even words and phrases...

...and dissolve ambiguities. A good natural-language-based system provides the foundation for this system, because it **parses** sentences thoroughly, **extracts** meaning from context, and is smart enough to realize that if the year is 1999, Hilary Rodham Clinton and the first lady are the same person. A document-processing tool is required that can **extract** and store many layers of meaning, as well as automatically **categorizing** documents and identifying all variants of proper names. Each unit of meaning may also carry a time...

...on which someone added the document to the database. With relevant dates in place, later tools can **extract** automatically chronologies of events. Chronological information also enables the system to distinguish between first ladies Barbara Bush...

...time and context of the question. The information in the knowledge base should also be retrievable as **separate** units, such as a single sentence or paragraph, if we want it to supply direct answers to questions.

I stress this knowledge base building step because most **organizations** will not willingly invest the money, time, and effort needed to design a knowledge base more than...

...few years. Any future advanced information tool will operate on the contents of this knowledge base. Therefore, **extracting** as much knowledge as possible should increase the flexibility in the future to adopt new technologies, as...

...it when needed. This is the same principle that advises digitizing at a high resolution when scanning **collections**: Build the foundation ... present. While NLP systems match terms, like both Boolean and statistical search engines do, the systems also **extract** meaning from syntax, built-in lexicons, context, and even the structure of the text itself. This is...

...today. Interactions with today's systems are fixed in time. The searcher must change a query in **order** to find documents not already retrieved and to add new indexing terms manually. We need systems that...

...agents. and with the user. Agents may be mobile, traveling along the Internet or other networks in **order** to carry out various tasks, such as finding or delivering information, **ordering** books, or monitoring events.

Most importantly, agents can alter their behavior to fit a new situation. They...

...adapt to our preferences for formats or other repetitive actions we take -- like opening applications in certain **orders** or checking e-mail at a certain time of day -- and will perform these tasks automatically.

Eventually...

...distinct area of research with tools in development or, in some cases, already on the market.

Concept **Extraction** and **Mapping**

Concept **mapping** is the key to many new technologies on the horizon. Language provides rich alternatives in how an...to interpret meaning correctly and to relate similar expressions of an idea to the same concept.

Concept **mapping** enables us to:

- * Search across disciplines using different vocabularies to express the same idea.

- * Search across languages...

...a name or place, no matter how a question is phrased.

- * Index materials automatically.

Concept and vocabulary **mapping** are like creating a controlled vocabulary. In a controlled vocabulary, all synonyms are identified and one is chosen as the "official" term. Other terms cross reference to that official term. Concept **mapping** works in a similar manner, except that the concept does not need to be a single chosen...

...in any other language and well beyond the conceptual grasp of multilingual human dictionaries or thesauri.

Vocabulary **mapping**, a form of this technique, enables a searcher using MESH terms in MEDLINE to search intelligently in...

...another medical database with a different thesaurus in control. Thus, the idea of "tree" has multiple terms **mapped** to it, as shown below in Figure 3.

This is a technology already in place with varying...

...areas.

Machine-Aided and Automatic Indexing

Machine-aided or automatic indexing (MAI) finds major concepts in texts, **maps** them to an internal thesaurus or controlled vocabulary, and applies indexing terms automatically. It may also **extract** important names, disambiguate **words**, and **identify** new **terminology** for indexers to add to the system. MAI offers candidate terms to indexers for their approval. Automatic...

...automatically assign broad terms to all documents for its customer folders. Autonomy uses machine learning to automatically **categorize** materials, and Semio creates **taxonomies** or hierarchies automatically. Systems such as DR-LINK, developed by Dr. Elizabeth Liddy at Syracuse University, assign subject codes in **order** to disambiguate words. Some MAI systems work with up to 80 percent accuracy, which compares favorably with manual indexing.

Some experimental approaches use probability and statistics to **categorize** materials. Muscat, now owned by Dialog, is a good example of this approach. Others are experimenting with neural networks for automatic **classification**.

MAI systems can also **extract** important names from the text or "disambiguate" terms. Consider the term "bank." It may be a place...

...or railroad. Increasingly Web and other search engines use automatic indexing to disambiguate or to create broad **categories** for browsing.

MAI can speed up the indexing and abstracting process needed to prepare databases. It particularly...

...have this potential. There are two kinds of automatic summarization. The first summarizes whole documents, either by **extracting** important sentences or by rephrasing and shortening the original text. Most

summarization tools currently under development **extract** key passages or topic sentences, rather than rephrasing the document. Rephrasing is a much more difficult task...

...interest. Two approaches are in development. The first translates text from one language to another. The second **maps** words in the same language to a single coded concept, just as concept **mapping** does. Even rough wording or poor translation is adequate for cross-language retrieval. We can also use...

...retrieving foreign language documents, even if we can't translate the documents perfectly. The combination of concept **mapping** and automatic summarization can deliver a rough gloss or overview of an article so that a researcher can decide whether to read an entire document.

Entity **Extraction**

Entities are names of people, places or things. As we all know, entities are often difficult to locate within a **collection** of documents because many variant terms may refer to the same person. For instance, "AT&T" may...names or terms as they occur in new materials. NetOwl is one example of a product that **extracts** entities. For decades, LEXIS-NEXIS has used name variants in **order** to improve retrieval, but automated **extraction** and storage give this policy far more power.

Relationship **Extraction**

With **extracted** entities in hand, one can perform some interesting analyses across documents. For instance, one could find out who has met with whom over the time period of the **collection**. This kind of data analysis requires that the system **extract** relationships among entities. Some systems can **extract** more than 60 different types of relationships, including some that describe time or tense and numbers. Natural language researchers have developed **categories** to describe these relationships. For instance.

* The ISA relationship defines who or what the subject is: "Gil...

...the Southern Hemisphere causes severe sunburns."

Tools like KNOW-IT, developed by Woojin Paik of Solutions United, **extract** entities and store their relationships to each other. This involves a larger **chunk** of information than single words or even phrases, consisting of the subject, the object, and the kind...

...this can answer questions such as, "Who fired the president of Consolidated Widget Company?"

Chronological and Numeric **Extractions**

If a system can determine when and what event was happened, or how large something is compared to...

...the Widget companies that produce more than 5 million widgets a year." With this kind of information **extracted** from its contents, the system can also construct chronologies of events. This may not seem earth shaking...

...In other words, text mining, looks at the whole database, not just a single document, and then **extracts** information from all the pertinent documents in **order** to reveal patterns over time or within a subject. These technologies perform some analysis on text in...

...the knowledge base on which it operates. If relationships, concepts, chronological information, and entities have already been **extracted**, then, the text-mining process can take advantage of this information and seek patterns within it.

Question...

...According, which may or may not contain the answer. Question-answering systems find the best matching answers **extracted** from within matching documents. If users need more information, they can link to the source documents.

Filtering...

...looks for new documents of interest. To set up a filter, the user creates, a profile or "**standing** query," which runs against any new

additions to the database. The art of designing a **standing** query lies in creating a broad enough query to prevent the omission of important developments, while making...

...A search engine that can provide well-focused retrieval, preferably using some sort of disambiguation and concept **extraction**, will most likely catch related topics.

One of the major problems with any kind of **standing**, continuing query, or monitoring service is that the terminology in any field changes over time. So do...Filtering tools that incorporate machine learning can detect new terms and offer to add them to a **standing** query. They can also, note changes in the user's interests and adapt the query to fit...

...people sitting under a tree at a picnic to reading a description of the same scene. In **order** to help people interpret large sets of data or documents, many researchers are designing visual equivalents of...

...a standard screen, but it contains all the elements that a user would want to have in **order** to interact well with an information system. It displays documents, related concepts, and key Phrases, all in...

...experts, and computer scientists need more than the anecdotal information we get front us-ability tests in **order** to establish guide-lines for, good design. We do know that people have many different cognitive styles...

...a system. While the interface determines how the information displays, what it displays depends on the data **extracted**. Thus, relevance **rankings** easily display as bar charts. The amount of information available on a topic can show as a...

...of subject content. It can create star charts, showing clusters of documents, or the imaginary land-form **maps** from Cartia). Look at this visualization of a set of search results from Cartia in Figure 6...

...draft11/daveloc4.html) at the University of Maryland gives an instant overview of the Library of Congress **collections**. As you pass your mouse over each timeline, it turns blue, and so do the types of **collections** that contain information about that time period.

Query formulation is one of the weakest spots in the...

...8 below) and Dotfire, its newest form, are dynamic query tools. These tools present a set of **categories** that help to narrow down a ...the technical paper by Ben Shneiderman, David Feldman, and Anne Rose, "Visualizing Digital

Library Search Results with **Categorical** and **Hierarchical** Axes," CS-TR-3992, UMIACS-TR-99-12, February 1999, <ftp://ftp.cs.umd.edu/pub/hcil> ...

...box shows the user, at a glance, the number of tours that exist in each of the **categories** requested during the time period indicated For instance, 87 canoeing tours are offered during a specific time...

...discover patterns.

Northern Lights custom folders give you a quick visual overview of search results The careful **categorization** of contents makes searching Northern Light both broad and well focused. Northern Light also searches Yahoo! directory...

...We need to read what we find, but we also need to merge sources, pull them apart, **separate** the data, into **categories**, sort the data, seek patterns, and **send** the **information** to colleagues and clients.

Puffin Search (<http://www.puffin-ware.com>) invites this kind of interaction. It...

...any cell in the table as a basis for comparison. Choose a title and it will re-**rank** all other hits by their similarity to that title. Or, choose several of the keywords and **rank** all 1,200 hits by the terms you have chosen. You can sort by search engine or...

...<http://www.hci.cornell.edu/projects/projs/multimedia.htm>):

Netbook allows users to capture images from digital **collections**, store, and view them on a user's personal netbook page. Thumbnails of images can be **organized**, allowing users to build a manageable **collection**.

Annotator allows users to annotate or read annotations to images that have been taken from an online **collection** or a Netbook. A class of students for example can view the annotations an instructor has made to an image or create their own annotations visible to their classmates.

Authoring helps users manipulate, **organize**, and display research and data with **hierarchical** and hypermedia links. Students can view the work of others and **organize** and make their own links.

Artview transforms online image **collections** from museums and other sites into collaborative learning spaces. At the same time but from different locations...

...each other using a shared text window.

Searching Multiple Sources Simultaneously

Searching across different kinds of information **collections** poses one of the biggest challenges facing digital library and intranet builders.

Collections may encompass text or images or statistics. Text files may contain bibliographic records, abstracts, or full text. Image **collections** may only offer search engines the text appearing as captions. Once we move outside of controlled, integrated **collections** of the same kind of Materials, we encounter several obstacles. These include vocabulary differences, differences in type of materials, and differences in relevance- **ranking** algorithms.

Differences in vocabulary are a familiar problem to any experienced searcher; Each **collection** or source may use different terms to express the same idea. We professional searchers traditionally handle this...One could imagine trying to tweak a search system each time it adds a new kind of **collection**.

Searching across several systems complicates matters still further. Most search engines calculate the relevancy of a document...

...in part by finding out how rarely that term occurs in the database as a whole, and **collection** contains different materials, it is unlikely that what is highly relevant in one **collection** will **rank** the same way in another. Data fusion is a set of techniques for establishing a common ground...

...why Searching across files in Dialog or metasearching on the Web doesn't work well within relevance- **ranking** systems.

Here's an example. Suppose that: we decide to search for a few good articles on...

...Engine 2 concentrates on sports. Search Engine 1 finds 250,000 articles about high blood pressure. It **ranks** them. Search Engine 2 finds 10 articles, and they have only minimal information on the subject. Think...

...it gets a high weight. SO, Search Engine 2 gives all of these documents a 98 percent **ranking**. Since high blood pressure constitutes a common term in Search Engine 1, it gets a lower weight...

...systems. One technique takes one document from each in a round-robin approach. Another creates a virtual **collection** that merges all the documents found in all the databases. Then weights are reassigned based on this common **collection**. The second technique gives better results, but is computationally more costly.

Evidence Combination

Evidence combination improves retrieval from the same **collection** by using different retrieval techniques. It will be a hot topic in the next few years, as...

...miss important documents if the documents do not appear in the top 30 or 50 examined. Certain **ranking** algorithms clearly do a better job on one

type of document or another. Some may adjust for...

...vocabulary terms entirely. These are all reasonable design choices that may conform to a particular type of **collection**. While searchers cannot always understand why one search engine misses certain documents that another retrieves, we know...

...The differences in search algorithms may offer one explanation.

Evidence combination can refer to searching the same **collection** with different search engines and combining the results, or it can refer to using different sources to gather information about documents. For example, a **collection** of newscasts might be searched from speech text created by speech-recognition software. Closed-caption broadcasts would...

...from speech to text (speech synthesis). Both speech recognition and speech generation software must be developed in **order** to create good VUIs. The easier of these is speech generation. People already can understand computer-generated...Unisys, Dialogic, and AT&T.

Most of the research with NLP and speech recognition concentrates on understanding **word** boundaries and correctly **identifying** phonemes across diverse speakers and accents. This is a non-trivial task. One solution is to train...

...ask our car for directions and have it tell us where to turn next, after it has **mapped** out our route. In fact, that is available now. We will tell our agent to read us...

...fits how they think and work. For instance, we have never found a user population that can **distinguish** between "**subject headings**" and "keywords." Don't expect that they will learn. Just create a system that doesn't require...

...knowledge unrelated to their day jobs.

Create access models--subject, author, fields -- that make sense to your **organization**, even if this goes against library orthodoxy. If you only have computer science materials, don't expect that the Library of Congress **Classification** will be useful. Think about why **classification** schemes were invented and then use something that can help distinguish among the materials.

Last, design the...

...Conclusion

All these technologies add up to a seamless suite of information tools that will find information, **organize** it, keep it up to data, forage for patterns, and present understanding. In other words, an Answer...from gathering isolated facts and statistics. We must comprehend and clarify the place of information in the **organization**. This is a role for practical visionaries.

Fortunately for us, that's exactly who we are.

Susan...

...freely, use portions of the text and illustrations for other purposes, or include the article in future **collections**.

Here are some samples of questions difficult to answer in traditional information retrieval systems:

Identify bacteria in...

...I need to keep upon new information technologies as they appear. (This means that I need to **identify** new **terms** and also to drop those that have become outdated.)

Tell me when my competitors have come out...

...new product. I don't want any other press, releases.

WHAT EXACTLY DO MEAN BY MEANING?

People **extract** meaning from text on many levels:

* Phonetic is the actual sounds made when we pronounce words. This...

...Syntactic is the role each word plays in a sentence. Many of today's

search engines can **parse** a sentence, as we learned to do in elementary school, in **order** to pick out the subjects, verbs, objects, and phrases. This enables the engines to distinguish between Bill...ss pc= and (ec=1? or ec=6?) and (predict? or projecting or projected or future or **forecast** ? or trend or outlook or year0 (200? or 201?)

(2:30 that day)

Dennis (calling boss): Hi...

...can to get you the info you need. I'm using Puffin Search to merge and relevance **rank** the searches I did in Dialog, NEXIS, and Dow Jones. Is it okay with you if I...

...9:00.

OUTCOME: Dennis had to quit, having missed both lunch and dinner, at document 322, in **order** to have time to write the summaries and bullet points in time. Document 463 showed that Automated...

...retirement. Dennis went on to help create a company-wide information system, designing templates for interaction and **categories** for automatic indexing.

Automated Widget Company, October 5, 2009. 10:00 AM

Boss: Good Morning, Alvin. We...

...you want this? What format?

Boss: I need it by noon today. Give me lists of products, **organized** by name of company. Then I'd like of summary of trends in the industry. Just summarize...

...6 months ago.

Alvin: Same format?

Boss: Yes, but make the charts a larger font size. Also, **extract** the major points and put them and the charts in a slide presentation. Give me a **separate** slide on MS Widgets. I want that one by 1 PM.

Alvin: Anything else?

Boss: No, that...

...figures and produce a list for each company. Then I will find trends and predictions. I will **extract** major points that appear in two or more articles or are mentioned several times in one article...profile. They have developed a "company's coming" remote control module that hides clutter, inventories the refrigerator, **orders** groceries, cleans the house, turns on the oven, and changes the sheets.

In the MS Widgets report...

...we have a unique perspective about information itself. We understand how to ask the right questions in **order** to kind what we need. We understand balance in **collections**, good sources, and how to **categorize** materials so people can find them. This is invaluable. We also have something the others may lack...

...what to look for as you go about putting together an intranet or information system for an **organization**. These thoughts are tentative because they haven't been tested, and may theories are just as suspect...

Increase Your Bottom Line: Automated Customer Service and Marketing.(Aptex Software SelectResponse 3.0 and SelectCast)(Product Information)

Edwards, Larry M.

e-Business Advisor, 17, 7, 30

July, 1999

LANGUAGE: English RECORD TYPE: Fulltext; Abstract

WORD COUNT: 2606 LINE COUNT: 00219

ABSTRACT: Aptex Software's SelectResponse 3.0 and SelectCast are 'intelligent' client-server software solutions that allow companies inundated by overwhelming numbers of e-mail and Web-based queries to maintain their customer service quality, without having to add and train new employees to deal with the crush. SelectCast and SelectResponse mine unstructured content, such as FAQs, customer inquiries and knowledge bases, and automates customer interactions online.

... online shoppers is critical to achieving the response ratios necessary for financial success.

Enter Aptex Software, Inc., **ranked** one of the top personalization software applications by Forrester Research. Aptex develops "intelligent" client-server software that...

...needed for this task). The software dusters incoming e-mail messages that don't fit into a **predetermined** category, and the tuner sets up a new category for each duster detected. The tuner then sends...

...and direct-mail response rates, and to selectively target audiences that fall into identified behavioral groups or **categories** by personalizing and targeting responses. It's intended to benefit online publishers, e-commerce sites, and direct...

...automating online advertising and promotions, based on real-time customer behavior. The software is distributed in three **categories** or modules: Ad Server, Commerce, and Content.

"This is predictive marketing," Gaffney explains. "We are profiling the..."

...present product offers to customers based on their shopping profiles.

SelectCast for Content automatically manages document input **streams**, builds logical **information** channels, and presents content customized to each user's interests. This module is used by **organizations** that package news digests for online distribution, including News Edge, PointCast Corporation, and Data Times Corporation, as...is known as collaborative filtering. That is, a set of rules is preprogrammed into the system. When **keywords** and phrases are **identified**, the associated responses are returned in accordance with those rules.

"The key thing is, how good is..."

...5; Net Perceptions received a 4. Since then, however, analyst Paul Hogan has modified his stance somewhat, **ranking** Net Perceptions at least as high as Aptex.

His change in sentiment is not based on technological...a broker. Autoresponses are created with information from knowledge-bases, which contain 120 FAQs and some 600 **categories** of previous e-mail responses. Customer inquiries not automatically answered are **ranked** by urgency, and immediately routed to a broker for a response. SelectResponse also attaches to each message...

...CASE STUDY--SelectCast

PointCast, Incorporated is a free Internet news service that provides information in 43 industry **categories** to its subscribers. But these are broad **categories**, and subscribers want more specific information. To that end, PointCast plans to launch a new service this fall that will provide several hundred "PointCast Topics" its subscribers can chose from.

"There is some remedial **categorization** by the content providers,

but not nearly to the granular level that we require to really be...

...in better ways," Perna says. "That's really what its key value is, creating better ways to **categorize** the content and make it more personal to our viewers. That's what it's all about...

Call Center Roundup. (Buyers Guide)
Teleconnect, 16, 12, 78(1)
Dec, 1998
DOCUMENT TYPE: Buyers Guide ISSN: 0740-9354 LANGUAGE: English
RECORD TYPE: Fulltext; Abstract
WORD COUNT: 6375 LINE COUNT: 00527

ABSTRACT: A guide to call-center products is presented. Vendors are listed alphabetically, along with a brief description of products available. Artisoft's TeleVantage 2.0 is a PC-based system for smaller businesses, while Apropos offers a suite of modules that can handle larger installations. Some products, such as those from Blue Pumpkin, are designed for workforce management. Brightware's Internet Front Office customer-assistance software modules handle telephone and Internet support services. CosmoCom, Digital Techniques, and IEX Corp offer a variety of options. Melita International and NICE Systems are known for their automatic call distribution packages. Nortel Networks' offerings are among the most comprehensive. Siemens' ResumeRouting software implements 'call by call' routing using computer/telephone integration technology. Other vendors include Spectrum, Telecorp Products and Virtual Hold, whose namesake ACD enhancement performs automatic callbacks.

ABSTRACT: An overview of the best products on display at the 1998 CT Expo is presented. Products were evaluated in such areas as mainstream telephony products, network-based phone systems and new developer tools. The new APS2000 by Bogen offers an alternative to voice mail. It includes a smart site-paging transmitter that occupies calls while providing users with pickup instructions. JTAPI is a new subsystem by Java Telephony API, that allows communication between Java software and central servers. This allows users to build client applets for call control and place it on a Web site to be retrieved by employees with Java compatible browsers or a stand-alone-Java-virtual-machine.

ABSTRACT: GrapeVine Technologies' GrapeVine for Lotus Notes groupware management system facilitates information sharing, according to GrapeVine founder and CEO Cyril Brookes, by delivering information that is relevant. The program uses the Knowledge Chart **classification** system to let companies classify all their corporate information and include keywords and phrases describing the way the business works. GrapeVine users maintain an Interest Profile with keywords based on those used in the Knowledge Chart; they weight each keyword in their profile to set the amount of **information** they will **receive** on each topic. National Semiconductor will receive 1,000 licenses for GrapeVine in a deal worth more than \$500,000; other GrapeVine customers in the US include Lotus, HP, Consolidated Natural Gas, Dow Chemical, and M.W. Kellogg.

... government agencies are continually bombarded by information from both internal and external sources. The challenge for these **organizations** is to be able to use this information effectively and to manage the knowledge gained, said Cyril Brookes, GrapeVine Technologies' founder and chief executive officer.

"The biggest barrier to most information-sharing products is **organizational** culture," said Brookes. "But GrapeVine is designed to work around cultural problems. In fact, it's changing..."

...shared with the appropriate people without having to know who they are." This is enabled by a **classification** system called the Knowledge Chart.

The Knowledge Chart allows companies to classify all their corporate information, whether...

...their databases, or coming in from such sources as bulletin boards, news

services and E-mail. Each **organization** tailors its own Knowledge Chart so that it contains the keywords and phrases that describe the way...

...business changes, the company modifies the Chart.

Each GrapeVine end user also maintains an Interest Profile with **keywords** -- **identifying** areas of interest based on those in the Knowledge Chart. Users then rate each keyword in their...

...knowledge, not just-in-case data. GrapeVine will also help our people exploit the knowledge in our **organization** without duplication, and so enhance our service delivery."

GrapeVine for Notes, said Gall, lets users throughout the...

...review incoming information on their projects, they log it if it's useful. The data then gets **categorized** for action or comment by team members or other departments, or escalated to the team leader or...

...New South Wales. This research focused on what some call "unstructured information" such as ideas, rumors and **forecasts**. Brookes founded GrapeVine Technologies in 1986 to commercialize his research. "We perceived that there was this huge...to target large corporations that face a major information sharing or overload problem. These would include any **organization** with more than 500 Lotus Notes or Exchange users, he said.

"We have a very strong alliance...

...quickly to capture market share. By 1997 the information-sharing market is going to be on the **order** of \$1 billion a year."

Safari for Ads...includes a series of customization options ranging from different car models and artwork through logos, contact information, **maps**, etc. The core technologies Automatrix employed to develop the application were FileMaker and Xpress, glued together with...

...level while remaining consistent with the overall campaign.

CCI features Word, production control

In its theater and **separate** demonstrations, CCI Europe emphasized new features for production control and the integration of Word into its NewsDesk system.

CCI said it has received **orders** for NewsDesk editorial systems from 14 newspapers. It is being used in production by two of them...remember, IBM was the official supplier of computer-related tools for news coverage in Lillehammer.

In a **separate** project, Dagbladet chose Lotus Notes as the "reporter toolbox" to provide reporters with a local and a...

...The concept behind the CCI Ad System is to combine decentralization and pagination with database control, in **order** to offer integrated production and output of display ads, classified pages and ad stacks. Work is under...

...new gateway will be a standard product to which any vendor or system integrator can interface in **order** to get full, two-way communications with "old" Atex editorial systems.

In the case of the integration to move into the North American market. We've already reported an **order** from the Toronto Star. Another one comes from Compton Publishing, which will use the system to produce...editions and runs shorter than 2,000 copies.

Codesco features wire, Planner Xtensions

Codesco is a versatile **organization**, developing its own Quark Xtensions, marketing third-party Xtensions and plug-ins in German-speaking countries, and...

...kerning, as a style that can then be applied to other elements.

* Hotline automatically calls Codesco and **sends** it **information** about the specific Macintosh, Xpress and Xtensions in use so that this information can be used by...

...RNIS networks; and software modules from Sun, Sybase, Archetype, Quark, Adobe, Corel, Microsoft, etc.

The company is **organized** into three departments to provide custom software development and networking, system integration, and service and support for...tremendous amounts of resources into r&d and the manufacturing of its own hardware and software. In **order** to push sales of its own hardware, it may choose to market a system that uses as...

...system at VUM (Vlaamse Uitgeversmaatschappij) in Belgium. For those not already familiar with the company or the **order**, VUM is a publishing house that publishes De Standaard, Het Nieuwsblad and De Gentenaar newspapers, with a...Financial stability helps Baseview distinguish itself from other vendors in the newspaper industry.

After announcing several significant **orders** at Nexpo, Harris has tallied another long list of **orders** for its XP21 product line (but not quite the length usually garnered by Baseview). The list includes **orders** for its NewsMaker editorial system and a significant **order** from the New York Post for a classified system.

Believing the European market is dominated by desktop...database can be set up to resemble an Atex J11 system, particularly in the way queues are **organized**. The database can load 1,400 files in three seconds when scrolling through wire stories. The directory...part of ISGI's development. Monigraaf systems are either integrated into the ISGI system or sold as **separate** systems, which is most common in Scandinavia.

ISGI has three development groups: in Finland, where Windows software ...

...years ago, ISGI contracted with the Hamburg-based development group Pape and Partner for a number of **separate** modules for the planning of ad pages and for classified pagination. This project was later taken over...

...calendar for selecting publication dates appears flexible, allowing multiple publications and multiple zones (editions).

Pricing is kept **separate** from the main application, enabling easy customization to meet the needs of each newspaper.

Display and classified...

...pagination pass, the system generates a report of the volume of ads placed and not placed, by **classification**.

Editorial. The client editorial system, which also runs on Windows pcs, was shown with an Oracle database...advertising budget, color requirements and statistics for editorial and advertising mix. Once the configuration is set, the **standing** pages and logical sections of the publication can be assigned. The software also supports the placement of...

...release next spring. Those items will be covered in our next issue.

Business units. The company has **organized** itself into **separate** business divisions, each concentrating on a specific market area. At IFRA, the focus was on the Publishing...

...which covers newspaper and magazine markets and whose primary product is the Linopress system. With the new **organization**, the work of each division will be project-based, thus giving its project managers complete responsibility for...

...and Partner for ad and page planning, Hasselblad for picture wire services, URW for logotype generation, Digital **Collections** for text and image archiving, and GFI for commercial edp. The company emphasized that the partnerships aren...

...and enhanced production of ad pages.

All ads allocated to a page will be shown in a **separate** window. These will be dragged and dropped onto the page using the mouse or keyboard. Pagination will allow for flowing ads from the back or front of sections, and there will be controls over **classification** headers on repeat columns or pages. Linopress is one of a number of systems to have an ...and switch to 3B2 to compose the ad.

The ad taker's software includes a series of **predetermined** formats or styles the ad taker can apply to the copy. The 3B2 software picks up the ...

...relational database while maintaining incredibly fast access times.

The magic is achieved by running a very efficient, **separate** search engine in parallel with the sql database, allowing nearly instantaneous browsing of the whole database and...as elements that can be included with other systems. It was interesting to see the number of **organizations** looking at these systems. It seems this technology is being viewed by other vendors and also users...Station. To make its systems fast and flexible on deadline, Multicom keeps page geometry and page content **separate** throughout the editorial process. The page file is simply a list of page elements and geometry, without...

...database.

What makes Mets unique is its implementation -- its approach to the interface and how it links **separate** components. Although it is targeted at new customers, Mets supports the existing GBT Mentor customer base. The ...page. If more than one person is working on a page, the page can be split into **separate** elements, with each user having part of the page locked from other users. Xtensions handle creating rules...When the Norwegian company ND Comtec lost its place as a competitive system vendor, it left its **organizations** in other countries without any centralized source of direction. They were on their own in finding new...elements to page areas. This allows for mixed schemes in which different area templates are used on **separate** parts of the page, thus accommodating different column grids on a page. Page areas are assigned to...pictures for makeup on Xpress page templates. The Article module contains a survey window that displays articles **organized** to show only those that are applicable to the page or publication in question.

Text editor. The...

...which, if found, can be routed to a particular folder.

The wire-photo module has four separate **modules**: receiver, picture adaption, browser and makeup for automatic placement of pictures on Xpress pages. The receiver module...

...page appear in the specific page folder for that page. It is possible to specify the order **in** which articles should be placed, such as to link articles, as might be the case with news...system contains many other modules we didn't have a chance to look at, including some separate **Xtensions**; an ad dummyping system for laying out ad pages; an administrative system for the manager; a search...

...profile, etc.

For special advertising campaigns, it is also possible to group advertisers according to all classification **criteria**, e.g., branch, number of staff, class, postal codes and telephone area codes. A group can

then...

...mail, and the result can be merged with a letter created in Word.

For each ad order, **it** is now possible to record the advertiser, the agency, the creator and the customer to whom the...

...is to be published. An ad can then be booked in all products with the same order.

Further, to each classification, **ad** type, page, width, etc., it is possible to link a specified typographic style.

With Logix, Sypress's system for handling images, it is possible to have images (e.g., logotypes) stored by classification, **advertiser** or global considerations. Included as part of the image-handling software are routines for purging logos that...products, VIP Classix is more interactive than the older Classix. Classified ads are arranged under each classification **heading**, subheading, etc., which will appear in a predefined order. **The** user can alter this order.

The interactive pagination allows the user to pre-place ads or modify the automatic placement on the screen...

...called and placed on the Xpress page, with editorial text added on top of it.

In order **to** use Classix, ads under specified classifications have to be selected and sorted in the system. The result...

...next couple of years.

An interesting application of gis technology is editorial graphics in which detailed maps **locate** the scene of a news story, such as an accident.

Sysdeco's gis systems are used today...in the database. This information is then used to retrieve and manage the production flow.

In order **to** be customizable, Sysdeco has included more than 70 different fields of administrative information with each article, only...about it. But we were told that it will handle all types of ads, including taking orders **and** customer information; ad content; issues relating to production of display ads, space reservation and classified pagination; and...be as substantial as the \$80 million was five years ago.

On the bright side, while forecasting **no** new business in 1994, while it was in bankruptcy, SII received several major orders **and** reported more than \$42 million in revenues. If these sales figures are an indication of product acceptance...

...a library of available shapes and styles. There can be multiple catalogs in a system, and separate **catalogs** for different parts of a page. A layout can be changed by applying a different catalog; the...browse functions to navigate around different subjects. At the present time, text and graphics archives are separate **systems**, but they will come together next year.

URW moves into ad makeup

Best known for its extensive...

...Macintosh, Windows and os/2 computers, allows users to manipulate and compose display ads from a hierarchical **database** of objects. These objects can be individual characters, lines of text, groups of lines, layers or total...

ABSTRACT: Open systems are necessary for the implementation of distributed multimedia applications. An infrastructure supporting a distributed system helps alleviate the problems associated with individual multimedia applications residing on standalone computers and equipment. Routing, session control, network management, presentation and multimedia device control, media synchronization, and resource allocation all become difficult to administer on proprietary systems. Bellcore's Touring Machine

testbed addresses issues involving creating applications for widespread distributed multimedia systems. The project creates prototype software platforms for multimedia telepresence applications.
